Example 1; Page 127-130; 169pp; English.

The present sequence is that of cDNA encoding GmANT1, a newly identified CC AINTEGUMENTA-like (ANT-like) polypeptide of soybean. The cDNA comprises CC the insert of clone CPR67663, which was obtained from a soybean sequence Cd database screening using Arabidopsis ANT as query. Also isolated was CC clone CPR67626 (see ABN84481) encoding GmANT2 (see ABP9637). GmANT1 and CC GmANT2 show homology to ANT in 2 N-terminal AP2 DNA binding domains, but CC thave C-terminal sequences that bear little, if any, homology to ANT in CC comprising, in the N-terminal to C-terminal direction, 2 AP2 DNA binding CC comprising, in the N-terminal to C-terminal direction, 2 AP2 DNA binding CC comprising, in the N-terminal to C-terminal direction, 2 AP2 DNA binding CC comprising to ANT-like polypeptides have been identified in soybean, CC rice, cotton and corn (see ABB79636-41). Nucleic acids (see ABB480-86) CC encoding the ANT-like polypeptides have been identified in soybean, CC transgenic plants, especially corn, soybean, canola, wheat, cotton, CC tomato or potato (all claimed) having improved agronomic, horticultural CC comprise polyperides (all claimed) having improved agronomic, horticultural CC constoned to the sequence sale technology to CC suppress endogenous ANT-like gene expression, in sense technology to CC modulate expression of endogenous ANT-like gene sthat they are part of, as CC markers for traits linked to those genes, or in the identification of CC loss of function mutant phenotypes of a plant due to a mutation in one or more endogenous genes encoding the ANT-like polypeptides

                               The present sequence is that of cDNA encoding GmANT2, a newly identified AINTEGUMENTA-like (ANT-like) polypeptide of soybean. The cDNA comprises CC the insert of clone CPR67626, which was obtained from a soybean sequence Cd database screening using Arabidopsis ANT as query. Also isolated was CC clone CPR67663 (see ABN94480) encoding GmANT1 (see ABH96363). GmANT1 and CC GmANT2 show homology to ANT in 2 N-terminal AP2 DNA binding domains, but have C-terminal sequences that bear little, if any, homology to ANT. The CC invention provides nucleic acids encoding ANT-like polypeptides (comprising, in the N-terminal to C-terminal AP2 DNA binding domains, but the CC encoding the ANT-like polypeptides have been identified in soybean, crice, cotton and corn (see ABH9656-41). Nucleic acids (see ABH9480-86) CC encoding the ANT-like polypeptides have been identified in soybean, CC tomato or potato (all claimed) having improved agronomic, horticultural CC or other quality traits, such as increased size of plant organs. These plants are especially useful for production of ethanol or animal federatific acids may also be used in antisense technology to modulate expression of endogenous ANT-like gene expression, in sense co-suppression to makers for traits linked to those genes, or in the identification of compression mutant phenotypes of a plant due to a mutation in one or more endogenous genes encoding the ANT-like polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example 1; Page 134-137; 169pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           increased size of plant

Initial OsaNTI clones had CC been identified in a rice database screening using the newly identified Sybpen ANT-like polypeptide GmaNTI as query. An additional rice clone (see ABN84483) encoding OsaNTI (see ABB79639) was also isolated OsaNTI CD polypeptide shares high homology with Arabidopsis ANT, GmaNTI and GmANTI CC the N-terminal APZ DNA binding domains, shares conserved segments with GmaNTI and GmANTI CC the N-terminal plants. The invention provides nucleic acids encoding ANT-like polypeptides comprising, in the N-terminal to C-C terminal direction, 2 APZ DNA binding domains followed by an amino acid consumption and corn (see CC polypeptides were identified in soybean, rice, cotton and corn (see CC polypeptides were identified in soybean, rice, cotton and corn (see CC polypeptides can improved agronomic, horticultural or other quality CC traits, such as increased size of plant organs. These plants are CC especially corn, soybean, canola, wheat, cotton, tomato or potato (all cspecially useful for production of ethanol or animal feedstuff. The mucleic acids may also be used in antisense technology to suppress CC endogenous ANT-like genes that they are part of, as markers for traits of plysically mapping the genes that they are part of, as markers for traits of clinked to those genes, or in the identification of loss of function cutant phenotypes of a plant due to a mutation in one or more endogenous and construction of a plant due to a mutation in one or more endogenous and construction of loss of function cutant phenotypes of a plant due to a mutation in one or more endogenous and construction in one or more endogenous and c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is the coding region for OsANT1, a newly identified AINTEGUMENTA-like (ANT-like) polypeptide of rice. The cDNA was obtained by PCR amplification using gene-specific primers (see ABM84496-97) using panicle cDNA as template. The cDNA was not amplified from root or leaf cDNA, suggesting tissue-specific expression. Initial OsANT1 clones had
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 1926

The present sequence is the coding region of the rice OBANT2 gene cancoding a newly identified AINTEGUMENTA-like (ANT-like) polypeptide. The CC enroding a newly identified AINTEGUMENTA-like (ANT-like) polypeptide. The CC OBANT2 gene (see also AEN84483) was isolated following a rice database comparising on the Noterial sequery. Another rice clone (see AEN84482) encoding OBANT1 (see AEN79638) was also collected. The invention provides nucleic acids encoding ANT-like polypeptide sencoding ANT-like polypeptides contained in the Noterial to C-terminal direction, 2 AP2 polypeptides comparising, in the Noterial to C-terminal direction, 2 AP2 polypeptides were identified in those given in AEN79629-35. ANT-like polypeptides were identified in construction of transgenic plants, especially corn, soybean, canola, wheat, cotton, tomato or potato (all claimed) having improved agronomic, comparison, tomato or potato (all claimed) having improved agronomic, comparison, towato or potato (all claimed) having improved agronomic, comparison, towato or potato (all claimed) having improved agronomic, comparison, towato or potato (all claimed) having improved agronomic, comparison, towato or potato (all claimed) having improved agronomic, comparison, towato or potato (all claimed) having improved agronomic, comparison, to suppress endogenous ANT-like gene expression, in sense comparison, to genetically and physically mapping the genes that they are purposes ion to modulate expression of endogenous ANT-like genes, as probes for markers for traits linked to those genes, or in the comparison of endogenous genes encoding the ANT-like due to a construction in one or more endogenous genes encoding the ANT-like due to a construction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleic acids encoding AINTEGUMENTA-like polypeptides improving agronomic, horticultural, and quality traits of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence encodes an aintegumenta (ANT) polypeptide. The ANT gene is expressed and functions not only in developing ovules but also in various developing organs. Growth and cell proliferation in plant can be modulated by modulating ANT activity. Modulation of ANT activity is used to alter organ mass, control fertility and enhance asexual reproduction in plants. Increased ANT activity can be used to produce male or female sterile pilants. Inhibition of ANT activity can be used to truncate vegetative growth, resulting in early flowering
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Modulating growth and cell proliferation in a plant used to alter organ mass, control fertility and enhance asexual reproduction in plants comprises modulating ANT activity and selecting plants with altered cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI; 2000-465969/40.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel cassette for the transgenic expression of nucleic acid containing the promoter of the LOX5 gene from Arabidopsis CC thaliana or deletion variants of the LOX5 promoter which are functionally CC linked to the mucleic acid of the invention. The cassette is used to CC prepare transgenic organisms, especially plants, for production of foods, animal feeds, seeds (including those with increased resistance to stress CC and disease, altered starch/lipid contents or dormancy, or altered fibre CC content), pharmacceuticals (especially antibodies, vaccines, enzymes and CC pharmaceutical proteins) and fine chemicals (especially enzymes and CC perfumes and dyes), also to produce sterile plants. The LOX5 promoter CC provides strong and specific expression in cotyledons and/or other early CC embryonic tissue, so can degrade, or protect against, stress factors to CC which these tissues are particularly sensitive. Since cotyledons are the CC cotyledons is homogeneous, there are no side effects on other plant CC organs (pollen) and the promoter is functional value. Expression in the CC cotyledons is homogeneous, there are no side effects on other plant CC entryledons and the promoter is functional value. Expression in the CC cotyledons and the promoter is functional value expression in the CC cotyledons and the promoter is functional value expression in the CC cotyledons and the promoter is functional value expression in the CC cotyledons and the promoter is functional value expression in the CC cotyledons are the promoter is functional value expression in the CC cotyledons are the promoter is functional value. Expression in the CC cotyledons are the promoter is functional value expression and the promoter are no side effects on other plant cotyledons.

The ANT gene is expressed and functions not only in developing ovules but also in various developing organs. Growth and cell proliferation in plant can be modulated by modulating ANT activity. Modulation of ANT activity is used to alter organ mass, control fertility and enhance asexual reproduction in plants. Increased ANT activity can be used to produce male or female sterile plants. Inhibition of ANT activity can be used to truncate vegetative growth, resulting in early flowering
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Modulating growth and cell proliferation in a plant used to mass, control fertility and enhance asexual reproduction in comprises modulating ANT activity and selecting plants with

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes an isolated nucleotide fragment (I) comprising a nucleic acid sequence (NS) chosen from a NS encoding a CC comprising a nucleic acid sequence (NS) chosen from a NS encoding a CC comprising a nucleic acid sequence (NS) chosen from a NS encoding a CC cativated protein (MAP)-kinase activity, LIPIS-like transcription factor activity and CKC-like transcription factor activity and CKC-like transcription factor activity. Also described: (1) CC complement (II) of (I); (2) a chimeric construct (III) comprising (I) or CC comprising (III) in its genome; (4) sequence; (3) a plant (IV); and (5) CC comprising (III) in its genome; (4) sequence; (3) a plant (IV); and (5) CC conjustion or co-suppression in a transformed plant. (III) is useful for CC canola, Brassica, sorghum, sunflower or coconut. (III) is also useful for CC canola, Brassica, sorghum, sunflower or coconut. (III) is also useful for CC used as a hybridisation probe. ACC00626 to ACC00668 and ABR40591 to CC alreation properson used in the exemplification of the present in the exemplification of the present connection.

activity, caleosin-like activity, ATP citrate lyase activity, SNF1-like activity and CKC-like transcription factor activity. Also described: (1) complement (II) of: (I); (2) a chimeric construct (III) comprising (I) or (II); operably linked to a regulatory sequence: (3) a plant (IV) comprising (III) in its genome; (4) seeds (V) obtained from (V); and (5) oil obtained from (V). (I) or its part can be used in antisense inhibition or co-suppression in a transformed plant. (III) is useful for altering the oil phenotype in a plant such as corn, soybean, wheat, rice, canola, Brassica, sorghum, sunflower or coconut. (III) is also useful for creating transgenic plants having altered lipid profiles. (I) can also be used as a hybridisation probe. ACC00626 to ACC00868 and ABR40591 to ABR40879 represent sequences used in the exemplification of the present invertice.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes an isolated nucleotide fragment (I) comprising a nucleic acid sequence (NS) chosen from a NS encoding a comprising a nucleic acid sequence (NS) chosen from a NS encoding a polypeptide (PP) having receptor-like protein kinase activity, mitogen activated protein (MAP)-kinase activity, LIP15-like transcription factor activity and CKC-like transcription factor activity. Also described: (1) cc activity and CKC-like transcription factor activity. Also described: (1) cc complement (II) of (I); (2) a chimeric construct (III) comprising (I) or comprising (III) in its genome; (4) sequence; (3) a plant (IV) and (5) cc comprising (III) in its genome; (4) seeds (V) betained from (IV); and (5) coll obtained from (V). (I) or its part can be used in antisense coll obtained from (V). (I) or its part can be used in antisense constitution or co-suppression in a transformed plant. (III) is useful for canola, Brassica, sorghum, sunflower or coconut. (III) is also useful for creating transgenic plants having altered lipid profiles. (I) can also be used as a hybridisation probe. Novel nucleotide fragment encoding polypeptides having receptor-like protein kinase activity, caleosin-like activity, useful for altering oil phenotypes in plants such as sunflower, coconut, soybean, wheat and rice.

Claim 18; Page 379-380; 542pp; English.

CC The present invention describes an isolated nucleotide fragment (I) comprising a nucleic acid sequence (NS) chosen from a NS encoding a CC polypeptide (PP) having receptor-like protein kinase activity, mitogen activated protein (AMP) kinase activity, LIPIS-like transcription factor activity and CKC-like transcription factor activity. Also described: (1) cc complement (II) of (I); (2) a chimeric construct (III) cmprising (I) or CC (II), operably linked to a regulatory sequence; (3) a plant (IV) and (5) cc comprising (III) in its genome; (4) seeds (V) obtained from (IV), and (5) cc inhibition or co-suppression in a transformed plant. (III) is useful for canola, Brassica, sorghum, sunflower or coconut. (III) is also useful for creating transgenic plants having altered lipid profiles. (I) can also be used as a hybridisation probe. ACC00626 to ACC00868 and ABR40591 to incent construction.

The gene was isolated CC AINTEGUMENTA-like (ANT-like) polypeptide of rice. The gene was isolated CC following a rice database screening using soybean ANT-like polypeptide CC formall as query. The coding sequence is given in ABN84484. An additional rice clone (see ABN84482) encoding OsANTI (see ABB79638) was also CC isolated. The present invention provides nucleic acids encoding ANT-like CC polypeptides comprising, in the N-terminal to C-terminal direction, 2 AP2 DNA binding domains followed by an amino acid subsequence selected from CC those given in ABB79629-35. ANT-like polypeptides were identified in CC soybean, rice, cotton and corn (see ABB79636-41). Nucleic acids (see CC ABN84480-86) encoding the ANT-like polypeptides can be used in the CC construction of transgenic plants, especially corn, soybean, canola, wheat, cotton, tomato or potato (all claimed) having improved agronomic, CC wheat, cotton, tomato or potato (all claimed) having improved agronomic, CC wheat, cotton or tomato or potato (all claimed) having improved agronomic, CC construction or enderson potato (all claimed) having improved agronomic, CC animal feedstuff. The nucleic acids may also be used in antisense compression to modulate expression of endogenous ANT-like gene expression, in sense conjugate of genetically and physically mapping the genes that they are probated of agrantic for traits linked to those genes, or in the CC antication in one or more endogenous genes encoding the ANT-like contracted in an or more endogenous genes encoding the ANT-like contracted in the contracted in 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              не
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acids encoding AINTEGUMENTA-like polypeptides useful in improving agronomic, horticultural, and quality traits of plants, such increased size of plant organs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Example 2; Page 147-151; 169pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1711

                                                                                                                                                                                                                                        The present invention describes an isolated nucleotide fragment (I) comprising a nucleic acid sequence (NS) chosen from a NS encoding a CC comprising a nucleic acid sequence (NS) chosen from a NS encoding a CC polypeptide (PP) having receptor-like protein kinase activity, mitogen CC activity cated protein (MAP) kinase activity, LTP15-like transcription factor CC activity and CKC-like transcription factor activity. SNF1-like CC complement (II) of [I]; (2) a chimeric construct (III) comprising (I) or CC (III), operably linked to a regulatory sequence; (3) a plant (IV) and (5) CC comprising (III) in its genome; (4) seeds (V) obtained from (IV); and (5) CC conjustion or co-suppression in a transformed plant. (III) is useful for CC canola, Brassica, sorghum, sunflower or coconsut. (III) is also useful for CC canola, Brassica, sorghum, sunflower or coconsut. (III) is also useful for CC creating transgenic plants having altered lipid profiles. (I) can also be used as a hybridisation probe. ACC00626 to ACC00668 and ABR40591 to invention
